

In practice

With a physician's prescription, the patient has a blood sample taken at a biomedical laboratory.

Biologists enter the data directly online and get the result's report immediately.

Registration is free at www.biopredictive.com

After **FibroTest-ActiTest's** launch in 2002, which has since turned out to be the reference in its field, BioPredictive once again breaks new ground with the **SteatoTest**, **NashTest**, **AshTest** and FibroMAX.

FibroMAX

Distributed in the U.S.A

The components of FibroMAX :

Sex, Age, Weight, Height, Alpha 2 macroglobulin, Haptoglobin, Apolipoprotein A1, Bilirubin, ALAT, ASAT, GGT, Glucose, Triglycerides, Cholesterol.

40 rue du Bac 75007 Paris

contact@biopredictive.com

www.biopredictive.com

Misinterpretation:

False negative : most frequently due to inflammation (high Haptoglobin)
False positive : most frequently due to hemolysis (low Haptoglobin) or Gilbert's syndrome (high Bilirubin)

Precautions for use:

Follow analytical recommendations to avoid variability
Postpone analysis if inflammation
Interpret results prudently if an isolated component has an extreme value (warning reports)
If discordant results check FibroTest's components extreme values and biopsy quality (>15mm, non-fragmented)

FOR THE 4 MOST FREQUENT

LIVER DISEASES

FibroMAX

THE COMPLETE DIAGNOSIS

WITH

● **FibroTest-ActiTest** ● **SteatoTest** ● **NashTest** ● **AshTest**

AN ACKNOWLEDGED DIAGNOSTIC TOOL

USING A SIMPLE BLOOD TEST

OFFERED EXCLUSIVELY BY

www.biopredictive.com

FibroMAX what is it ?

A new generation test, painless and without complications.

A biomarker combination :

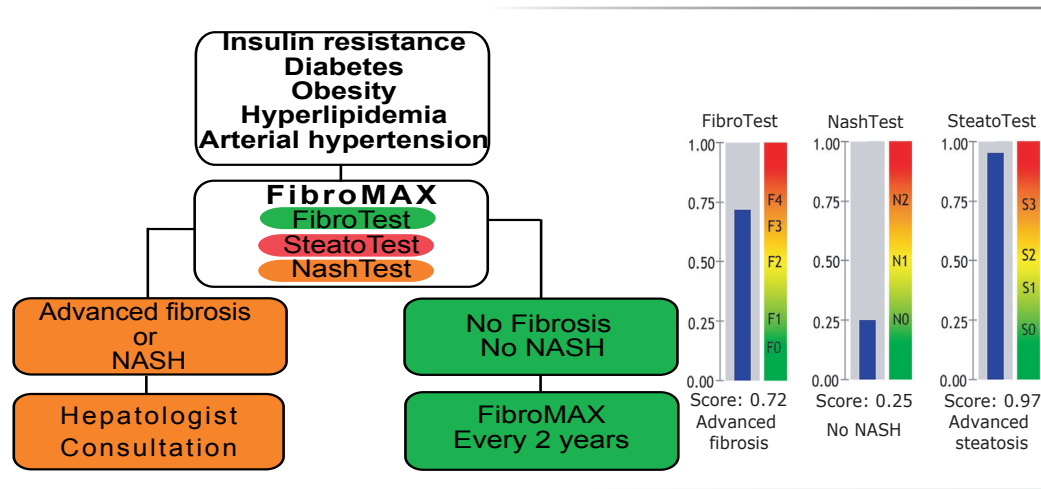

FibroTest, **SteatoTest**, **NashTest**, **AshTest** and **ActiTest**.

Is diagnostic not only for liver fibrosis but for its worsening factors.

Combines 5 expert algorithm tests patented by Assistance Publique des Hôpitaux de Paris.

Combination of 6 to 12 biological parameters.

A web connection at www.biopredictive.com a link with more than 30 international publications.

FibroMAX's five tests ?

FibroTest :

Is diagnostic for hepatic fibrosis, the common denominator of liver disease.

SteatoTest :

Is diagnostic for hepatic steatosis or "fatty liver", the most common cause of ALT and GGT abnormalities .

NashTest :

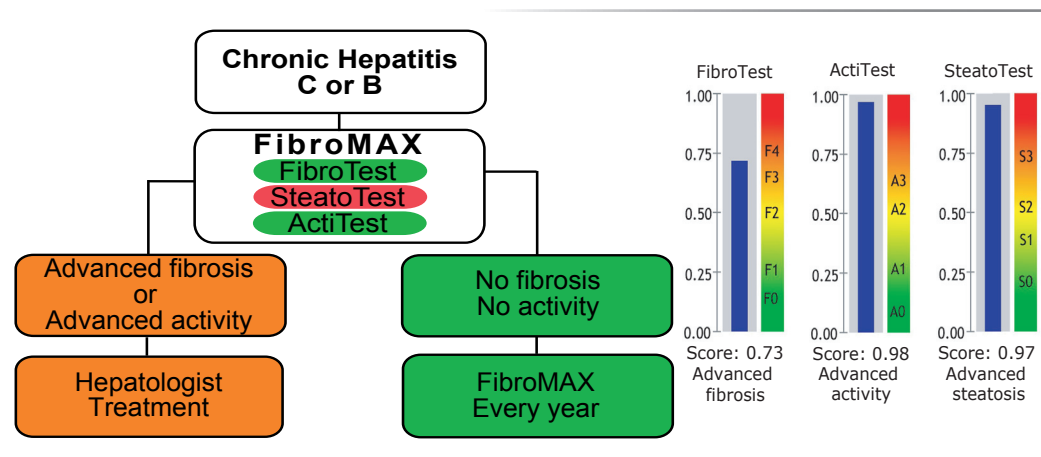

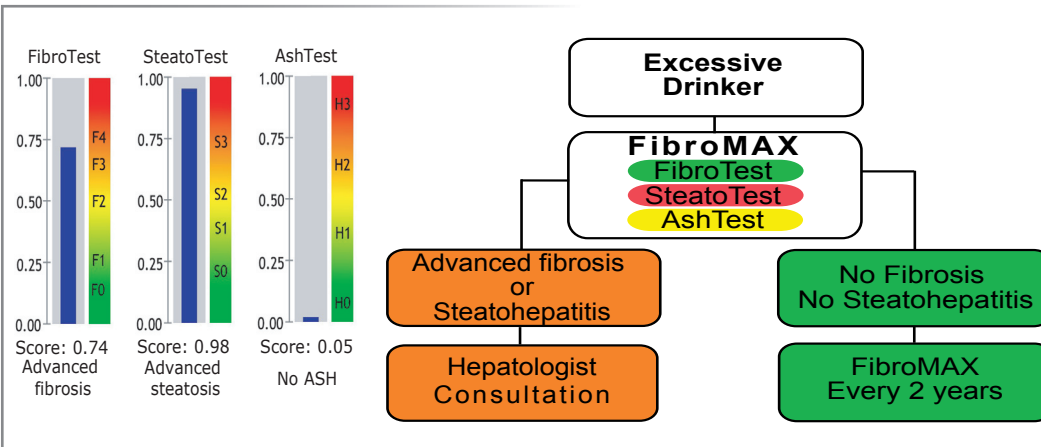

Is diagnostic for non-alcoholic steatohepatitis (NASH) (overweight, diabetes and hyperlipidemia, insulin resistance).

AshTest :

Is diagnostic for severe alcoholic steatohepatitis (ASH) (excessive drinkers).

ActiTest :

The only non-invasive test available for necroinflammatory activity.

To whom is the FibroMAX directed to ?

FibroTest and **SteatoTest** for every patient with hepatitis C and B, alcoholic liver disease and non-alcoholic steatosis.

And according to risk factors :

NashTest for non-alcoholic steatosis

(overweight, insulin resistance, hyperlipidemia or diabetes).

AshTest for alcoholic steatosis (excessive drinkers).

ActiTest for hepatitis C and B.
